

Wellness Testing Consent Form

Between one and seven years of age, our pets are in the prime of their lives. This is the time they venture out of adolescence into adulthood. But this is also the time that some diseases can begin to effect your pet's health. These diseases can go unnoticed in their early stages and, if left undetected, can put your pet's health at risk and even shorten their life. Therefore, **preventive health care is very important.**

The best approach to caring for your pet includes:

- Physical Exams since our pets age much faster than us.
 - ◆ Annually for pets 1 to 7 years old
 - ◆ Semiannually for pets over 7 years old
- Preventive testing to:
 - ◆ Establish baseline blood values to serve as a comparison when changes occur.
 - ◆ Identify existing health problems that aren't detected through physical exam alone.
 - ◆ Monitor progress during treatment if abnormalities are detected.

We will talk to you about conducting preventive care testing during your pet's visit today. The tests we recommend are similar to and equally as important as those human physicians run on their patients. After we run the recommended tests, we can help you understand your pet's current health status and common medical conditions your pet could face. We will also discuss a regular monitoring plan for your pet's health.

The combination of tests we recommend for the adult pet are listed below:

<u>Adult Wellness (1 to 7 years)</u>	<u>Canine</u>	<u>Feline</u>	<u>Senior Wellness (over 7 years)</u>	<u>Canine</u>	<u>Feline</u>
